An Empirical Analysis of Saving Behavior among Malaysian Employees

Shafinar Ismail, Nadia Syazwani Khairuddin, Nurul Ezaili Alias, Wei Loon-Koe, Rozana Othman
Faculty of Business and Management; Universiti Teknologi MARA, Melaka, Malaysia

Abstract
People were found to be more conscious on spending their money. Therefore, it is important to identify the savings behavior as people are more to spend rather than to save. Overspending can lead to various implications, such as bankruptcy because of the inability to settle up their unpaid payments to creditors (Zhu, 2011). However, there is a lack of research on the determinants of factors affecting the saving behavior. Thus, the aim of the study is to identify the factors affecting the saving behavior. Three determinants are identified which are as follows: services quality, religious belief and knowledge. Questionnaires were distributed to the 150 respondents. The sampling procedure adopted was purposive sampling. The data obtained were analyzed using SPSS which involves scale reliability, descriptive, and regression analysis. Semi-structured interviews were conducted to cross-check the quantitative findings. The result indicates that services quality, religious belief and knowledge influence saving behavior. This study makes a contribution to the literature on saving behavior. The findings achieved in this study will be of interest for practitioners and academics concerned with money management skills in order to become financially independent for long term.

Keywords: saving behavior, questionnaire, regression analysis, semi-structured interviews

Introduction
People need the personal-finance management in their lives as decisions made in early adulthood will impact a person’s entire life, especially decisions that adversely affect credit and finances. The importance to this study is to identify the factors affecting saving behavior. It is important to identify the saving’s behavior as people are more to spend rather than to save as saving money is very useful for emergencies (Barnes et al., 2011), future used (Griskevicius et al., 2013) and also for retirement. Overspending can lead to various implications, such as bankruptcy because of the inability to settle up their unpaid payments to creditors (Zhu, 2011). Personal bankruptcy issues have been a pressing concern to the governments, bankers, creditors, and financial researchers in recent years. Offering important body of information to financial institutions helps them evaluate the risk of their credit portfolio in a timely manner, as well as helping them to formulate their respective risk management strategies (Min & Lee, 2008). People who failed in managing their personal financial can lead to the
financial problem such as bankruptcy when they do not have money to pay their debt and this will bring on a feeling of embarrassment, stress, guilt, and anger. Apart from that, when someone does not plan their personal financial very well, they will face difficulties in developing their lives such as delaying marriage or not getting married at all, postponing having children (Ismail et al., 2011). Notably, in 2015, it was reported in the Annual Report of Malaysia Department of Insolvency that the average of bankrupt individuals per day was 51 and there were 83 cases of personal bankruptcy being registered per day (Malaysia Department of Insolvency, 2016). In the same year, the Secretary General of the Federation of Malaysian Consumers Associations (FOMCA), Datuk Paul Selvaraj indicated that the rising cost of living, moderate salary increments and low retirement savings would only worsen the situation if the personal bankruptcy issue was not addressed soon (Carvalho & Hamdan, 2015).

Savings are likely to play a very important role in promoting real growth. Several empirical studies found a positive effect of the saving rate on the long term growth (Cardenas and Escobar (1998), Motely (1994) and Krieckhaus (2002). People’s savings, in particular, assist in smoothing out unexpected variations in income, minimizing the impact of shocks on consumption. In a country like the Malaysia, where a lot of resident in rural area are engaged in agriculture and face uncertainty from weather and natural calamities, it would be helpful to understand how people deal with fluctuations in incomes. Further, savings serve as a vehicle of social mobility and of enhancing future income earning possibilities. Savings indeed have implications in the welfare of households, macroeconomic, growth and development. In the Malaysia, however, it has been noted that the savings rate is becomes fluctuate overtime. On the other hand, there is a possibility that Malaysian are actually saving more but not through formal financial instruments. Previous studies on savings look at differences in the saving behaviour of urban and rural households. Some studies focus on the forms and determinants of rural savings. Due to the inadequacy of recent and comprehensive data and information regarding the behaviour of household savers through time, the study designed to increase savings interest. From some fact that researcher found, it proof that saving is one of the important things that should be concern by consumer and government. In addition, saving can be used during peak situation such as during inflation time.

Therefore, the researcher intends to analyze what are the factors that affecting the saving behavior in Malaysia. The following section considers previous studies relevant to saving behavior, while next section presents the details for the methodology to achieve the study objectives. Most importantly, section 4 analyses the findings generated from the survey work. In the section 5, a further discussion of results and study implications are highlighted in order to gain more understanding on factors affecting saving behavior, followed by a conclusion.

Theoretical Background and Literature Reviews

Saving is the money that person has saved, especially through bank or official scheme. There are many reasons for saving. Keynes (1936), stated that there are three motives for saving, which were for transaction, precautionary, and speculative. Modigliani and Brumberg (1954), suggest that individuals formulate financial plans for retirement (Browning and Lusardi, 1996). Individual practice saving habit throughout their lifetime, beginning slowly in their early years, peaking during forties and fifties and finally accumulating sufficient funds to retire (Karpel, 1995); however, according to
Modigliani and Brumberg (1954), saving levels are low for the young, rise and peak during the middle years, then become lower again among the old.

Service's quality is the customer's overview of the service's component of a product and estimating it helps to understand how the customers satisfy with the product and services or not (Goeldner and Ritchie, 2006). Usually, a service quality links between what customer's wish from a service and what they perceive that they received (Mackay and Crompton, 1988). Good quality of services will give to the customer satisfaction, employee satisfaction and profitability (Nakhai and Neves, 2009). According to Varoglu and Eser, (2006) customer no longer just expect good and best quality goods but also high levels of service provided along with them. For this study, service's quality can be related with the service's quality provided by a bank. Example of it is in terms of how friendliness the banker at the counter; good brand's product offers by bank and time taken to entertain the customers. Therefore, we make the following hypothesis:

**H1:** Services Quality has significant relationships with the saving behaviour

Apart from service's quality, religion also plays an important role in effecting the saving behaviour (Mitchell, 2003). According to Beyerlein & Hipp (2006), religion has a significant impact on individuals, group and community measures of civic life. Religiosity is the extent to which an individual has integrated the tenet of a particular religion into his or her attitudes, values and beliefs (King and Williamson, 2005). Religion usually encourages their followers to save money and do not waste money. Therefore, the following hypothesis is constructed:

**H2:** Religious belief has significant relationships with the saving behaviour

There are a variety of sources through which knowledge can be acquired. The knowledge of the importance of saving can be gained from education. These include formal education, such as high school or college course, seminars and training classes outside of school as well as informal sources such as from parents, friends, and work (Keller and Staelin 1987). The amount of savings has been associated positively with knowledge, which comes from education, wealth, income and age (Browning and Lusardi, 1996). People who are financially knowledgeable are more likely to behave in financially responsible ways (Hilgert, Hogarth, and Beverly, 2003). Bodie, (2002) stated that individuals repeatedly made the same mistakes in not saving their money because of insufficient knowledge of the importance of saving money. Therefore, we hypothesize:

**H3:** Knowledge has significant relationships with the saving behaviour

Following from the discussion in the previous section, the following theoretical model is developed as presented in Figure 1.

![Figure 1. Research Model](image-url)
Methodology

This study employs mixed methods for the purpose of data collection. The benefit of using mixed methods is to clarify that the data are communicating what we think they are; this notably strengthens the integrity of conclusions drawn from the data. For instance, in this study, quantitative approach (a questionnaire survey) have been implemented, followed by semi-structured interviews, in order to test, on a larger scale, the findings generated as a result of the literature review with the use of the structured questionnaires presented to a large sample of respondents. Semi-structured interviews were conducted to cross-check the quantitative findings.

The population for this research consists of the private sectors employees. In this study, the sampling design is purposive sampling. The data on this study are generated from responses to questionnaires completed at the actual survey. A total of 150 questionnaires are provided. We employ SPSS 20.0 in order to conduct frequency analysis, descriptive analysis, reliability and regressions’ analysis. Frequency analysis is used to extract the percentile of the profiles of respondents in terms of their gender, ethnics, age, religion, marital status and monthly income obtained. Mean and standard deviation are computed for descriptive analysis. The reliability test is used to examine the internal consistency among the items in their respective factors. Regression analysis is particularly used to test the hypotheses proposed earlier.

Empirical Result

RESPONDENTS’ PROFILE

Most of the respondents in this study are female, which represent 57.3 percent while male respondents are 42.7 percent. Out of 150 respondents, 58.7 percent are married followed by single with 40.7 percent and divorced 0.7 percent. The age ranges between 20 - 30 with 54.0 % followed by between 31 - 40 with 29.3 percent; and > 40 are 14.0 percent and <20 with 2.7 percent. Most of the respondents were Malay who represents 62 percent followed by Chinese with 20.7 percent followed by Indian with 13.3 percent, and the least races were others with 4.0 percent. 61.3 percent are Muslim followed by Buddhist with 15.3 percent, Hindu 12.7 percent, Christian 7.3 percent and others with 3.3 percent. For education level, 57.3 percent have Bachelor Degree followed by Diploma with 18.7 percent; Masters Degree with 13.3 percent and Sijil Pelajaran Malaysia (SPM) are 10.7 percent. Most of the respondents have the monthly scale salary at range >RM4,000 with 33.3 percent followed by RM1,000-3,000 with 30.7 percent, RM3, 001 to 4,000 with 30 percent. This study found that most of the respondents saved their money at Maybank with 51.3 percent, followed by CIMB bank with 18.0 percent, RHB bank 14.7 percent, Bank Islam 11.3 percent and others 4.7 percent.

DESCRIPTIVE ANALYSIS

Table 1 illustrates the descriptive analysis results. Firstly, variables of ‘saving behaviour’ is explained by item ‘Always Save Money ’ gets the highest mean with 3.88 and ‘Saving in Equal Amount’ is the lowest mean by 3.01. Thus, it indicates that item ‘Always Save Money’ has the strongest influence towards saving behaviour. The mean of 3.88 on a five point scale for media advertisement indicates that most of the respondents are neither bent neutral nor agree. The standard deviation of 1.18 shows how much variation or dispersion exists from its mean. The minimum number of one on variable of ‘saving behaviour’ indicates that there are respondents who strongly disagree with the
items saving behaviour and maximum number of five indicates some respondents are strongly agree with the items on the saving behaviour. Secondly, the variable of ‘services quality’ is explained by item ‘Friendly services at counter’ gets the highest mean with 4.36 and ‘services quality has an impact on saving’ is the lowest mean by 3.37. Thus, it indicates that item ‘Friendly services at counter’ has the strongest influence on services quality towards saving behaviour. The standard deviation of 0.95 shows how much variation or dispersion exists from its mean. Thirdly, the variable of ‘religion’ is explained by item ‘teach not to waste’ gets the highest mean with 4.27 and ‘strong sprit’ is the lowest mean by 3.71. Thus, it indicates that item ‘teach not to waste’ has the strongest influence on religion towards saving behaviour. The standard deviation of 1.01 shows how much variation or dispersion exists from its mean. Fourthly, the variable of ‘knowledge’ is explained by item ‘know the importance of saving’ gets the highest mean with 4.19 and ‘enough knowledge’ is the lowest mean by 3.77. Thus, it indicates that item ‘know the importance of saving’ has the strongest influence on knowledge towards saving behaviour. The standard deviation of 1.01 shows how much variation or dispersion exists from its mean.

RELIABILITY ANALYSIS

Table 2 demonstrates the result of reliability test, whereby the Cronbach’s alpha reliability coefficient is obtained for all variables. Most of the variables are above 0.70, and it is considered acceptable to measure for this study. Out of six variables, five are above 0.7 except for the services’ quality with 0.67. Firstly, measuring saving behaviour; the result is 0.79. According to Sekaran and Bougie (2010), it is considered as acceptable. Secondly, in measuring service’s quality; the result is 0.67, which is considered acceptable. Next, in determining religious belief, the result is 0.89, which is considered as very good. Further, in measuring the knowledge, the result is 0.83, which is considered as very good. In a nutshell, coefficient was obtained from all questions in Likert Scale are reliable.

REGRESSION ANALYSIS

Multiple regression analysis is a statistical technique to predict the variance in the dependent variable by regress it with the independent variables, besides assessing the degree and character of the relationship between the independent variables with the dependent variable (Sekaran & Bougie, 2010). Table 4 demonstrates the regression results. Services Quality is significantly associated with saving behaviour ($t = 2.95, p = 0.00$). Hence, $H_1$ is supported. It is also shown that religious belief is significantly related to saving behaviour ($t = 4.60, p=0.00$). Hence, $H_2$ is supported. It also suggests that knowledge are significantly associated with saving behaviour ($t = 3.37, p = 0.00$). Hence, $H_3$ is supported.

</tbody>
</table>
H3  | Knowledge has significant relationships with the saving behaviour  | 0.26 | 3.37 | 0.00 | Yes

Source: Developed for current study

H3 is fully supported as the relationship between knowledge and saving behaviour is significant. People who are financially knowledgeable are more likely to behave in financially responsible ways (Hilgert, Hogarth, and Beverly, 2003). The amount of savings has been associated positively with knowledge. An example of the comment from respondents includes:

‘....I know that many banks offers variety of services related to savings... some offers very good package.... If I open saving account now in ten years’ time I will the benefits from savings...’

Furthermore, quality of the service and religious belief also plays important role towards saving behaviour. The result from quantitative survey shows that both have statistically significant relationship with saving behaviour; thus, results indicate that both H1 and H2 are fully supported. Respondents in the follow-up interviews also confirmed this result, with respondents stating the following, for example:

‘...i am concern of services offers by the banks...customer service is very important for me .....’

‘...I believe saving money for future education is very important... my parents teach me not to waste...’

Conclusion, Implication and Future Research

The purpose of this study is to investigate the issue with respect to the factors that affecting the saving behaviour. Results of this study suggest that religious belief, knowledge and service's quality affects saving behaviour.

This study advances current knowledge by shedding light on some important factors related to saving behaviour. This study explains the effects of service’s quality, religious belief, and knowledge towards saving behaviour. It is worth noting that this study proposes a conceptual model as a framework to understand the determinants of saving behaviour.

The present study has three limitations. Firstly, the sample of this study is relatively small. Only 150 respondents involved in this study. Although this sample size meets the minimum requirement for multivariate analysis (Hair et al. 2010), larger samples are able to inflate the statistical power. Secondly, we choose only employees at private sector, which may explain that our findings may not generalize to employees in other sectors. Future studies thus are encouraged to include different samples to increase the generalizability of findings. Despite the mentioned limitations, this study offers with an improved understanding of factors influencing saving behaviour.
